

Case Study

ENVIROSCREEN 20-20

Client - Keepmoat Homes Yorkshire

Project Length - 12 months

Project Value - £33,000

Project - Wakefield Road, Fitzwilliam - Planned Housing Estate

Key Issues

Discovery of Asbestos during Excavation

Solution

Screening using the Ebsford Enviroscreen 20-20 was identified as the most suitable method for eradication. This option fitted best with the clients' timescales. Root barrier membrane was also installed in areas where excavations took place on the site boundaries to ensure that any viable rhizomes on neighbouring land did not grow back onto site.

Client Comments - "After unsuccessful treatment with herbicides in previous years we were delighted that Ebsford could offer a simple solution that would immediately remove the Japanese knotweed and also prevent landfill costs. To be able to leave the treated and uncontaminated soil on site reduced our costs and timescales so we were able to move forward with our development on what was a difficult plot of land."
